2.4 Work and Energy in Electrostatics 2.4.1 The Work Done to Move a Charge To move a test charge  $Q$  from point  $a$  to point  $b$ , how much work will you have to do? \_ (in opposite to electric force) The potential difference between points  $a$  and  $b$  is equal to the work per unit charge required to carry a particle from  $a$  to  $b$ . If you want to bring the charge  $Q$  in from far away and stick it at point  $r$ .

Griffiths, 2.1 The Electric Field 2.1.1 Introduction The fundamental problem that electromagnetic theory hopes to solve is this: What force do the source charges \( \$q\_1, q\_2, \dots\$ \) exert on the test charge \( \$Q\$ \)? In general, both the source charges and the test charge are in motion. The solution to this problem is facilitated by the](#)

The Electrostatic Field To calculate the force exerted by some electric charges,  $q_1$ ,  $q_2$ ,  $q_3$ , (the source charges) on another charge  $Q$  (the test charge) we can use the principle of superposition. This principle states that the interaction between any two charges is completely unaffected by the presence of other charges. The force exerted on  $Q$  by  $q_1$ ,  $q_2$ , and  $q_3$
