extreme, depending on their requirement for sodium chloride. While most marine organisms are slight halophiles, moderate and extreme halophiles are generally more specialised microbes inhabiting hypersaline environments found all over the world in arid, coastal and deep sea.

Halophiles - microbewiki

Halophilic extremophiles, or simply halophiles, are a group of microorganisms that can grow and often thrive in areas of high salt (NaCl) concentration. These hypersaline areas can range from the salinity equivalent to that of the ocean (~3-5%), up to ten times that, such as in the Dead Sea (31.5% average).

Halophiles 2010: Life in Saline Environments

HALOPHILES IN UNUSUAL ENVIRONMENTS AND HALOPHILES EXPOSED TO MULTIPLE FORMS OF STRESS. Most habitats explored for the presence of halophiles are thalassohaline environments that originated by evaporation from seawater, reflect the ionic composition of seawater, and have a nearly neutral to slightly alkaline pH.

Hypersaline Environments - SERC

We now know that hypersaline bodies of water that exceed the modest 3.5 % salt of earth's oceans are populated with rich communities of "halophiles," or salt-lovers. These microbes are in all three of the Domains of life, Archaea, Bacteria, and Eukarya (Baxter et al., 2005 , Felix and Rushforth, 1979), however, eukaryotes are in small numbers.

Life in Hypersaline Environments > Lake Tyrrell > USC Dana ...

Hypersaline environments have low biological diversity because the environment is so challenging. Halophily has evolved repeatedly over evolutionary time and halophiles come from all three domains of life.
