Arteriovenous malformations (AVM) and arteriovenous fistulas (AVF) differ from all other pathology affecting the central nervous system by their high-flow arteriovenous shunts. Permanent occlusion of these shunts is the essence and the challenge of therapy. Endovascular therapy and radiosurgery became accepted alternatives or adjuncts to surgery. In many instances the choice of the primary Neurosurgery of Arteriovenous Malformations and Fistulas ...

Arteriovenous malformations (AVMs) and dural arteriovenous fistulas (DAVFs) of the brain and spinal cord are among the most difficult and complex lesions to treat and pose a significant challenge to neurosurgeons and neurointerventionalists who deal with these lesions in everyday practice. The authors, a group of clinicians from Munich, Germany, with diverse experience in the management of

Arteriovenous Malformations Symptoms, Diagnosis and ...

Arteriovenous malformations (AVMs) are defects in the vascular system, consisting of tangles of abnormal blood vessels (nidus) in which the feeding arteries are directly connected to a venous drainage network without interposition of a capillary bed. Arteries carry oxygen-rich blood away from the heart to the rest of the body's tissues and cells. Veins return oxygen-depleted blood to the lungs and heart. Capillaries connect the arteries and veins. The presence of an AVM disrupts this vital

Arteriovenous malformations (AVMs) are abnormal tangles of arteries and veins. While many AVMs remain asymptomatic for life, they can cause serious problems when they occur inside the brain as a cerebral AVM, or in the brain's covering (the dura) as a dural AVM, or in the spinal cord as a spinal AVM.
