Regulation of gene expression includes a wide range of mechanisms that are used by cells to increase or decrease the production of specific gene products, and is informally termed gene regulation. Sophisticated programs of gene expression are widely observed in biology, for example to trigger developmental pathways, respond to environmental stimuli, or adapt to new food sources. Virtually any step of gene expression can be modulated, from transcriptional initiation, to RNA processing, and to the [Regulation of Gene Expression and Brain Function : R](#)
